

EXTENDS *Integers*

CONSTANTS *Goal, Jugs, Capacity*

ASSUME $\wedge \textit{Goal} \in \textit{Nat}$
 $\wedge \textit{Capacity} \in [\textit{Jugs} \rightarrow \textit{Nat} \setminus \{0\}]$

$\textit{Min}(m, n) \triangleq \text{IF } m < n \text{ THEN } m \text{ ELSE } n$

--algorithm *DieHarder*

```
{ variables  $x, \textit{injug} = [j \in \textit{Jugs} \mapsto 0]$ ;
  { while ( TRUE )
    { either with (  $j \in \textit{Jugs}$  ) fill  $\textit{Jug}[j]$ 
      {  $\textit{injug}[j] := \textit{Capacity}[j]$  }
    or with (  $j \in \textit{Jugs}$  ) empty  $\textit{Jug}[j]$ 
      {  $\textit{injug}[j] := 0$  }
```

When pouring from j to k , we first ask if $\textit{In}[j] + \textit{In}[k] > \textit{In}[k]$. If so, we make $\textit{In}[k]' = \textit{Cap}[k]$ and $\textit{In}[j]' = \textit{In}[j] - (\textit{Cap}[k] - \textit{In}[k])$; if not, we make $\textit{In}[k]' = \textit{In}[k] + \textit{In}[j]$ and $\textit{In}[j]' = 0$. In the former case, the amount poured is $\textit{Cap}[k] - \textit{In}[k]$; in the latter case, the amount poured is $\textit{In}[j]$, which equals $(\textit{In}[k] + \textit{In}[j]) - \textit{In}[k]$. In both cases, the amount poured is $\textit{Min}(\textit{In}[k] + \textit{In}[j], \textit{In}[k]) - \textit{In}[k]$.

```
    or with (  $j \in \textit{Jugs}, k \in \textit{Jugs} \setminus \{j\}$  ) pour from  $j$  to  $k$ 
      { with (  $\textit{poured} = \textit{Min}(\textit{injug}[j] + \textit{injug}[k], \textit{Capacity}[k])$ 
        -  $\textit{injug}[k]$  )
        {  $\textit{injug}[j] := \textit{injug}[j] - \textit{poured}$ 
          ||  $\textit{injug}[k] := \textit{injug}[k] + \textit{poured}$ 
        } }
    } } }
```
